Student downloads

Download the HTML website, student RStudio project, or PDF bundle. The RStudio package includes the lesson sources, exercises, teaching CSVs, required assets, and setup instructions.

Teaching datasets

Use the checked textbook CSV bundle for the active descriptive-statistics lessons. The data guide explains columns, units, sources, and verification limits.

The supplementary student age and height CSV supports histogram interpretation. Read its source and metadata limitations before using it.

The measure-limitations examples accompany Lesson 3. Their provenance notes distinguish instructor examples and original teaching illustrations.

Probability model inputs

Module 3 reuses the Restaurant CSV for finite-selection probabilities. Its later lessons enter explicitly cited aggregate counts and model parameters from the textbook directly in R. No individual daily-sales, customer, arrival-time, flight, or tire records are supplied or invented. Simulation outputs are artificial draws under a stated model.

Working with the course

Follow the numbered modules from the course home. Lessons, practice, and the integrated review appear in their teaching order. Instructor answers stay separate.

The student project README explains setup and rendering. The full source repository also includes syllabi under `syllabi/`. The instructor maintains a local-only `books/` collection of textbook PDFs and original publisher workbooks, and local guidance under `docs/`; those folders are excluded from GitHub and are not needed to use the supplied teaching CSVs.

Book chapters

Book chapters provides the supplied chapter guides and their recall cards, organized by book and edition.
